CARD domains are found in a number of proteins that transmit CC signals that activate apoptosis and inflammatory pathways in response to CC stress and other stimuli. Therefore, CARD-12 and its corresponding CC nucleic acid may be used in treatment and diagnosis of patients suffering CC from disorders associated with an abnormal level (an increase or a decrease) of apoptotic cell death or abnormal activity of stress-related pathways. The disorders include cancer, viral infections (e.g. caused by poxviruses, adenoviruses), autoimmune disorders (e.g. systemic lupus CC disease, amyotrophic lateral sclerosis), haematologic diseases (e.g. CC aplastic anaemia, myocardial infarction, stroke), inflammatory and immune CC system disorders (e.g. Crohm's disease, insulin-dependent diabetes, CC contact dermatitis, psoriasis, graft rejection, bacterial infections CC (e.g. tuberculosis, lepromatous leprosy), ischaemic and hypoxic brain CC injury, kidney ischaemia/reperfusion injury, excitotoxic brain damage, acute bacterial meningitis and liver disease.

These were derived from expressed sequence tags from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is

23-DEC-1999; 21-JAN-2000; N-PSDB; Isolated human polynuch treatment and diagnosis (HYSE-) 22-DEC-2000; ΥŢ 2001-457603/49 AAH99581 HYSEQ Liu C, ; 99US-0471275. ; 2000US-0488725. ; 2000US-0552317. 2000WO-US35017 polynucleotides encoding diagnosis of e.g. cancer, Drmanac ulcers and HIV

useful for V infection

the

cardiovascular; antianaemic; antiaggregant; haemostatic; vulnerary; antiulcer; osteopathic; dermatological; antiallergic; antiasthmatic; antidiabetic; cytostatic; neuroprotective; antidepressant; nootropic; antiparkinsonian; and immunostimulant. The proteins and polynucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production. The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, haematopoletic disorders, anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, AAH99166 to AAH99904 encode the human proteins given in AAM25225 to AAM25963. The proteins can have activities based on the tissues and cells they are expressed in such as antiinflammatory; antirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; central nervous system; virucide; anti-HIV; fungicide; antimutagen; cardiare nervous system; virucide; anti-HIV; fungicide; antimutagen; Claim 20; Page 240; 1217pp; English.

Its amino acid sequence was deduced from a CDNA clone (AAT71265) obtd. from a human foetal spinal cord cDNA library. NAIP polypeptides, esp. those containing at least two BIR (baculovirus IAP repeat) domains, can be expressed in host-vector systems and used to increase or induce apoptosis for the treatment of AIDS, neurodegenerative disease, myelodysplastic syndromes or ischaemic hnjury, to screen for (ant)agonists, or to produce antibodies useful for inhibiting apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New neuronal inhibitor of apoptosis - useful for diagnosing treating, e.g. cancer, AIDS or amyotrophic lateral sclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Korneluk

The invention relates to an excessive ovulation animal, which is a transgenic animal with a totipotent cell containing a DNA fragment containing a promoter sequence and a gonadotropic hormone coding sequence. The DNA fragment is in the somatic cell chromosome. The excessive ovulation animal is useful for improving the productivity animals. The method can improve the productivity of a useful animal.

                                                                                                                                                                                                                      by hybridomas, prepared by fusing antibody-producing cells of mammals immunized with an immunogen containing residues 256-586 or 841-1052 of a 1403 residue amino acid sequence, fully defined in the specification, or their partial sequence, with a myeloma cell line. The monoclonal antibodies are for the study of apoptosis disease onset mechanism, disease diagnosis and development of drugs to prevent and treat apoptosis-related diseases. The quantitation method with the monoclonal antibodies is simple and accurate by using a biological specimen. This sequence represents the human apoptosis inhibitory protein NAIP which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                          Simple and accurate quantitation of human apoptosis inhibitory protein (NAIP) with monoclonal antibodies, for disease diagnosis and development of drugs to prevent and treat apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Key

                                                                                                                                                                                                                                                                                                                                Novel human neuronal apoptosis inhibitor protein (AAW20033), or NJ is a negative regulator of apoptosis, partic neuronal apoptosis and, when deficient or absent, contributes to neurodegenerative phenotypes such as spinal muscular atrophy (SNA) and amyotrophic lateral sclerosis. Its amino acid sequence was deduced from a CDNA clone (AAT71266) obtd. from a human foetal spinal cord cDNA library. NAIP polypeptides, esp. those containing at least two BIR (baculovirus IAP repeat) domains, can be expressed in host-vector systems and used to increase or induce apoptosis for the treatment of AIDS, neurodegenerative disease, myelodysplastic syndromes or ischaemic injury, to screen for (ant)sgonists, or to produce antibodies useful for inhibiting apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "encoded by AAA"

The invention relates to an excessive ovulation animal, which is a transgenic animal with a totipotent cell containing a DNA fragment containing a promoter sequence and a gonadotropic hormone coding sequence. The DNA fragment is in the somatic cell chromosome. The excessive ovulation animal is useful for improving the productivity of animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                An excessive ovulation animal - productivity of animals

AAY09540
                    The present sequence represents a human apoptosis inhibitory protein. The apoptosis inhibitory protein is useful for the elucidation of the mechanism of various apoptosis diseases such as human spinal muscular atrophy and the diagnosis, the prevention and the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1180

                                                                                                                                      This sequence represents the human neuronal apoptosis inhibitor protein (CC (MAIP). The cDNA encoding this sequence was found on a region of the CDNA encoding this sequence was found on a region of the CC artificial chromosome 5q13. This sequence was isolated from a yeast CC artificial chromosome (YAC) contig containing the D58435-D58112 interval CC of the chromosome 5q13. Mutations in the NAIP gene, are causative of CC spinal muscular atrophy (SMA) types I, II, and III. SMAs are a group of CC autosomal recessive, neurodegenerative disorders. SMAs are classified CC into the three types based upon the age of onset (with type I being the CC severest form with the earliest age of onset). All three types are CC severest form with the degeneration of the alpha motor neurons of the CC spinal cord manifesting as weakness and wasting of the proximal voluntary CC muscles. The most common mutations of the NAIP gene sequence are thought to be deletions of exons 5 and 6, and reductions in the copy number of CC used for the diagnosis of SMA, and for directing the formulation of CC used for the diagnosis of SMA, and for directing the formulation of CC conventional and genetic therapies for SMA. Identification of genes showing homology with the NAIP locus, and proteins that interact with

The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAM05439 standard; Protein; 73
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2001-488897/53.

                                                                                                                                                                                                                                                                               The present invention relates to novel single exon nucleic acid probes (see AAI00010-AAI10067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, stagling, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative
                                                                                                                                                                                                                          Note: The sequence data for this patent did not specification, but was obtained in electronic for at ftp.wipo.int/pub/published_pct_sequences.

DISEASE: MUTATED OR DELETED FORMS OF NAIP HAVE BEEN FOUND IN

INDIVIDUALS WITH SPINAL MUSCULAR ATROPHY TYPE I (SMA TYPE I). SMAS

ARE FATAL AUTOSOMAL RECESSIVE DISORDERS SUBCLASSIFIED AS TYPE I

(WERDNIG-HOFFMANN DISEASE), TYPE II (INTERNEDIATE FORM), AND TYPE

III (WOHLFART-KUGELBERG-WELANDER DISEASE) BASED UPON THE AGE OF

ONSET AND CLINICAL SEVERITY. THESE NEURODEGENERATIVE DISORDERS ARE

CHARACTERIZED BY DEGENERATION OF LOWER MOTOR NEURONS, LEADING TO

PROGRESSIVE PARALYSIS MUSCULAR ATROPHY. CONCERNS 1 IN 6000
